

No Lawns Wiki

Welcome to r/NoLawns! We are a community devoted to alternatives to monoculture lawns, with an emphasis on native plants and conservation. Rain gardens, xeriscaping, strolling gardens, native plants, and much more!

*Please message the mods if you have good resources to add to the wiki.

Posting Guidelines

Rules

1. If you're posting an image, we want to see the yard. Pictures that are mostly background or not related to the subreddit will result in your post being removed.
2. If you're posting an image of a house that is not yours, do not include identifying features. We don't want to see house numbers or street names.
3. Post factual information. A source is not necessary but please be ready to provide one if asked, we don't want to misinform others.
4. Images should include a description unless tagged as a meme.
5. Any news articles/blog posts being posted are required to contain the link. If you post a news article title and/or picture without the link, it will be removed.
6. Simply posting areas of overgrown invasive species is not in the spirit of the sub. Spreading false information or disregarding information regarding invasive species can result in the removal of your post or comment.
7. Posts and comments can be removed if they are not in the spirit of the sub. This is at the moderator's discretion.

Crossposts

Crossposts are allowed, but they need to fit the spirit of the sub. Crossposting to complain about what someone else has done with a piece of land does not fit the spirit of the sub. We want to see positive transformations here, not just a sea of lawns and lost potential. In general, if the crosspost:

1. Is a cool example of a no-lawn
2. or fosters relevant discussion
3. and hasn't already been posted here.

It'll be allowed.

Posting for Help

1. Be as to the point as possible in your title.
2. Please include as much information as possible in your post. a. Include your location or as close as you can get b. Include your zone c. Include what plants you want or are asking about d.

Include any issues you may have such as space and/or shade e. Include anything you want to accomplish such as pollinator-friendly or food growing f. Include any other details that may help us answer your question

3. Please do not dox yourself, share your house number, google links or any other verifiable information that could reveal who you are or where you live.

These are not rules however, they are recommended:

- Give plenty of info, more information is generally better than not enough.
- Respond to comments, some people may have additional questions.
- Include photos when relevant
- Include anything you've already tried. Did you try a certain plant in a certain location and it failed? Include it so we can help
- Include any rules you may have to work within. Do you have an HOA or a very lawn-involved city government? Let us know the rules so we can work within them.

Make your Post Engaging

- Instead of posting: "What Should I do with my Lawn?" Try: "I have a lawn with these features but I would like to go no lawn and get these features"
- Instead of posting: "How do I start?" Try: "I've read about sheet mulching to begin my transition, what else would benefit my no-lawn process?"

Posting Images

- Posting an image for help, please post multiple pictures from all angles and explain the space if it's not well represented by the images
- Please do not post google images or aerial views of anyone else's property these posts may be removed.
- Please be careful posting google images or aerial views of your property. This is the internet, people may be able to find you in real life. Be safe.
- If you're dealing with a problem, take as many images as you need to properly display the issue and make the issue known. Also, include a great description.
- If you're showing something off, be aware of lighting and the time of day you take your photos. It's hard to tell how beautiful your garden is when it's half shadow and we can't see it.
- Try not to use photo filters if you're showing off a yard or asking for help. This may misrepresent your images and make it harder to give advice.

No Self Promotion/Company Promotion

Don't post here about your product or company - at all

- At the moment, we do not allow companies to promote themselves in this sub in any way. This includes blogs posted on a company website (i.e. a site that also sells products) and promotion by people not directly affiliated with the company. In general, it's pretty easy to distinguish users who are genuinely enthusiastic about a product from users who are trying to promote a brand. When it isn't clear, the burden of proof is on the user. You need to make it plausible to us

that you're a regular user and not using the sub to increase exposure for a specific brand.

- This rule includes more than just posts and comments: Your username or flair cannot contain a product or company you're affiliated with or are likely to be affiliated with.
- Now, we will give you a warning when we see suspicious activity. So as long as you're a regular user and heed our warning, everything will be fine. This rule is simply there to prevent people from abusing this sub for advertising.

FAQ's

Q. Does r/nolawns mean no lawn at all?

- **A.** No. r/nolawns is simply a space for discussing alternatives to traditional turf grass lawns, and especially, lawn *reduction*. Many of us here will still choose to keep small sections of lawn in addition to more productive spaces.

Q. Is nolawns anti turf grass?

- ****A. ****No. Many of us still use turf grass in parts of our yard since it's an extremely durable ground cover. But turf grass, like all lawns, is not an ecosystem. There are also many climates where turf grass is inherently impractical. This sub is dedicated to making these spaces more sustainable.

Q. This sub has a lot of clover posts... is a white clover lawn the best option?

- **A.** It's not the *best* option, but it might be a good starting place for some people. There's a lot to say about clover, which is why we gave it its own [Reddit Wiki Section](#). But it's important to understand that clover is still a lawn plant. This is NoLawns so we like to steer the conversation to lawn reduction first.

Q. Why plant native?

- **A.** Many native insects only eat one or two species of native plant. Monarch butterflies and their relationship with milkweeds are a great example. Monarchs *require* milkweeds in their larval state. Remove milkweeds from an area and you will not have Monarchs. But this relationship between insect and plant is way more common nature than most people know. The National Wildlife Federation has a [great page showing which plants have the biggest impact on their ecosystem](#); these plants are known as keystone species.

And remember, insects are at the bottom of the food chain. Most songbirds are insectivores, especially when raising their young. So if insect populations drop due to a lack of native plants, song bird populations drop too.

Q. How do I design a yard with more native plants?

- **A.** [The Wild Ones garden designs](#) are a great resource for designing a yard with native plant species.

Many local nurseries will work with you for free to come up with a landscape design. (The design is

often free as they know you will come to them for the plants.)

Q. Is There a Garden Designing Software so I can do it myself?

- **A.** The only one we have found so far that's free is, [SmartDraw](#). We are not affiliated at all and there could possibly be better options than this. Autodesk Inventor and SketchUp are both great options, but they have a high learning curve. *Some grid paper and a pencil can be just as good for planning!*

Q. How do you make a lawn for kids/pets to play in?

- **A.** There are many many options and they are all dependent on your location. This could include native grasses that don't grow high, clover, violets, etc. You should always double check what is native to your location. And remember, if you still need to have grass for children or pets, that's OK! You can carve out a patch of grass for them and use the rest of the space for native plants, a veggie garden, and other sustainable options. One way to view your yard is that it can be divided into "rooms" e.g. a fire pit area, garden, play area, and native plants in-between. Some examples of what this look like include:
 - [The Wild Ones garden designs](#)
 - *The Living Landscape* by Darke and Tallamy show a bunch of examples of this, like Ricke Darke's "strolling garden" and the Mt. Cuba Center botanical garden
 - Ben Vogt's yard in *Prairie Up*
 - [Urban Wild LTD's designs](#) shown here on instagram.

Q: What ground cover works best for high traffic yards (dogs & kids)?

- **Turf grass** is usually the best recommendation for high traffic areas. That's why it's used in parks and football fields. White clover can be added to a turf grass lawn to make it slightly more durable. Clover will help the most in areas where turf grass is already growing, but needs help. [Read our page on clover to learn more](https://www.reddit.com/r/NoLawns/wiki/index/clover_groundcovers/).
- **Mulch** is the next-best ground cover, necessary for the areas with the highest level of recreation. It's cheap, easy to replace, and not as messy as mud. If you have big dogs or especially active children in a small / shady / wet yard, mulch is usually the answer. Some people have had luck with just making tracks of mulch through the yard where dogs or kids have worn a path.

Q. Where can I buy seeds?

- **A.** You can check our [Native Plant Resources by Country](#) (links to Reddit) or if you're in the US you can view resources [by US State](#) (links to Reddit).

It's important to make sure the seeds you are buying are native to your area. Many seed mixes labeled "wildflowers" contain non-native annuals that look pretty but do little for your ecosystem. The worse case scenario is introducing an invasive or aggressive plant to your yard. Native plants have been growing for hundreds or thousands of years in your area and are already adjusted to your climate and location.

Q. Where do you guys get those cool garden signs that specify this is an intentionally wild yard?

- **A.** There are plenty of places you can get them but if you'd like to you can also certify your lawn with [The National Wildlife Foundation](#) and get one of their signs. You can also find pre-made signs on places like Etsy and probably even Amazon that do not require a certification or, check your local chapter of the native plant society.

Q. What about No Mow May signs?

- **A.** There's a downloadable one [on Reddit](#) or you may be able to go to a custom sign website and make your own as well.
